### *Issues that I found that need to be fix*

---

- When I scan a location, the focus needs to go to the scan items to start scan without the need to go manually to the field.
- When I scan the location, I will like to display a field on the screen where location we are in addition to the Success message that also need to change the ID for to Location Name

- On the Audit Report need to add the tblAssetDetails Location and the tblInvTakenDetails Location fields.
- On the Update Location screen, I need that will be separate process and not automatically when I press Update. I need to add a Link option on the menu to do this process. Like the same when I select Audit Report. I want to select like Update Location link and select the Audit and the system will show the Update Location Screen From here will update.
- One the Update Location you have and typo the link says UpdateLocaion and I need that you switch the Columns

- I want that the system if the Original Location that come from tblAssetsDetails is different from the tblInvTakenDetails the system will be mark the check mark automatically.

I think that If you update location the system will be replace the LocationID on the tblAssetsDetails with the LocationID on the tblInvTakenDetails. For that reason, I will prefer Print the Report and then Update the Location if the Administrative user want to update the location.

On the Ipad the Audit Report Not Show when I select Print the Ipad Present the following Report
